ANÁLISIS DE RESULTADOS Y RECOMENDACIÓN

4 grupos o clústeres generales

Buena Cohesión

Debido a la cantidad de variables la segmentación es más compleja Variables más relacionadas:

Número de tarjetas de crédito

Número de visitas al banco
(tanto en línea como físicas)

Número de llamadas

Cuantas más tarjetas tiene un cliente más visitas hace al banco

Cuantas menos tarjetas tiene más visitas en línea

Las variables de estado civil, educación y edad no son muy significativas
